

MANUAL SOOT TREATMENT DOSING UNIT FOR ONE EXHAUST GAS BOILER SYSTEM

The Manual Soot Treatment Dosing unit is an equipment used for the injection of FP Soot Remover Liquid Plus into the Exhaust Gas duct. The doser body is filled with 10 litres or less of treatment chemical for one or more dosing cycles, for the Exhaust Gas Boiler for which the unit is installed for. There is an inlet for the air supply, which atomizes the treatment chemical, and we get an atomized (air-chemical mixture) chemical spray as a fine mist through the Injection Nozzle. The operation of this unit is simple and manual.
