

Installation of pickup line

Pickup Line: A pickup line is a secondary rope used to lift or manipulate a spliced rope, typically during installation or maintenance.

Always ensure that the pickup line is centered within the eye of the spliced rope to maintain strength of the rope, prevent damage, and ensure safe operation.

Correct placement of pickup line

Incorrect placement of pickup line

Consequences of Improper Installation:

Splice Distortion: Uneven loading from the pickup line can distort the splice, reducing its strength and potentially leading to splice failure.

Rope Damage: Incorrect installation can cause localized wear and tear on the rope, particularly due to misalignment during tensioning.
